DETAILED ACTION

Election/Restrictions

1. Applicant's election without traverse of group II (claims 47-54) in the reply filed on 10/12/04 is acknowledged. Claims 35-46 are withdrawn from consideration as being drawn to non-elected subject matter.

Information Disclosure Statement

2. Some of the foreign references on the IDS have been lined through since copies of these references have not been provided.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 47,48 and 50-54 are rejected under 35 U.S.C. 102(b) as being anticipated by Metlitsky (US 5545886).

Metlitsky discloses an image capture device or bar code scanner including plural laser diode beam emitters(81-83) able

to operate sequentially and sharing a common scanning mirror(76), a photodetector(15) outputting a signal to a decoder(20) which produces a bitmap (fig. 19) image of the field of view.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claim 49 is rejected under 35 U.S.C. 103(a) as being unpatentable over Metlitsky (US 5545886) in view of Obata (US 5597997).

Metlitsky further discloses emission and detection of a plurality of unique wavelengths of light (fig. 17), but does not explicitly teach plural photodetectors for receiving the light. However, Obata teaches multiple detectors for the various wavelengths (see fig. 6a). It would have been obvious to the ordinarily skilled artisan at the time of invention to use plural detectors as shown by Obata as an art-recognized

Art Unit: 2872

equivalent means for multiple wavelength detection as the detecting arrangement shown by Metlitsky. Note that the use of multiple detectors would also provide greater flexibility in the positioning or calibration of the individual detectors.

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Tang teaches a bar code scanner with plural beam emitters and detectors, a scanning mirror and decoder. Krichever shows another arrangement for a bar code scanner.
